

AI Accelerator Chip Import And Export Control Agreement

HelioChip Logistics Ltd. and Meridian Research Compute - controlled AI accelerator procurement, import, re-export, and end-use restrictions

Synthetic legal-style test document for agent evaluation. Not legal advice. No real parties.

Transaction Overview

HelioChip Logistics Ltd. will source, import, warehouse, configure, and deliver AI accelerator hardware, high-bandwidth interconnects, firmware packages, and management software for Meridian Research Compute. The shipment may include items classified under export control regimes applicable to advanced computing, semiconductor manufacturing, encryption, and high-performance AI workloads.

No party may ship, re-export, transfer, lend, resell, virtualize, colocate, or make available the controlled items to any restricted party, embargoed destination, prohibited end use, or military-intelligence end user without written authorization and any required government license.

Export Classification And Licensing

- Supplier shall provide export classification numbers, harmonized tariff codes, country of origin, license exception analysis, encryption classification, and supporting manufacturer certifications before purchase order release.
- Potential classifications may include advanced computing controls, encryption controls, and related software controls. Final classification must be confirmed by the manufacturer or qualified export counsel.
- Importer of record shall verify whether import permits, re-export licenses, end-user statements, or strategic goods approvals are required for each destination and deployment site.

End Use And End User Certification

- Customer represents that the items will be used for internal research, model inference, secure analytics, and workload testing in approved data center locations only.
- Items shall not be used for nuclear, missile, chemical, biological, military command, surveillance targeting, weapons design, or restricted military-intelligence applications.
- Customer shall maintain asset inventory, deployment site records, operator logs, model workload categories, and access records for at least seven years.

Sanctions And Restricted Party Screening

Before each shipment, Supplier shall screen Customer, affiliates, freight forwarders, brokers, consignees, data center operators, financing parties, and known end users against applicable sanctions, denied party, unverified, military end user, and export restriction lists.

A positive or unresolved screening hit is a shipment blocker. The parties must document disposition, counsel review, and approval before release.

Data, Firmware, And Remote Access

- Supplier may receive device serial numbers, firmware versions, data center rack locations, network diagrams, import documents, operator contact data, and support logs.
- Supplier remote access for firmware support requires ticketed approval, time limits, named personnel, MFA, session recording, and customer observation where feasible.

- No production model weights, datasets, prompts, customer personal data, or inference outputs shall be transferred to Supplier unless covered by a separate security and data processing agreement.

Customs, Chain Of Custody, And Physical Security

- Supplier shall maintain tamper-evident packaging, serial number reconciliation, bonded warehouse controls, delivery photographs, and chain-of-custody logs.
- Lost, stolen, diverted, substituted, or delayed shipments must be reported within 24 hours with an incident record and corrective action plan.

Audit Rights

Customer may audit classification records, screening records, shipping documents, import permits, chain-of-custody evidence, and end-use certification files. Supplier shall preserve transaction records for seven years or longer if required by law.

Blocking Conditions

- No purchase order may be released without export classification, sanctions screening, end-use certification, delivery location approval, and importer-of-record confirmation.
- No support access may start without privileged access approval, firmware integrity evidence, and a documented support window.
