

Managed Platform Integration Services Agreement

OmniBridge Services LLC implementation and managed operations across ERP, HRIS, CRM, ITSM, collaboration, and data platforms

Synthetic legal-style test document for agent evaluation. Not legal advice. No real parties.

Services

OmniBridge Services LLC will design, implement, and operate integrations across Oracle ERP, SAP S/4HANA, Workday, ServiceNow, Salesforce, Microsoft 365, SharePoint, Power BI, Snowflake, Databricks, Jira, Okta, and customer-managed SFTP gateways.

The provider will build API connectors, data mappings, workflow automations, reconciliation reports, exception queues, and support dashboards. Some integrations will move regulated data between finance, HR, procurement, customer support, and compliance systems.

Data Categories

- Finance: invoice metadata, payment approval status, supplier bank change requests, purchase orders, budget codes, ledger extracts, tax records, and audit evidence.
- HR: employee identifiers, work email, manager, department, job title, location, onboarding status, and access request history.
- Customer operations: CRM notes, support case narratives, account identifiers, service entitlements, project milestones, and renewal data.
- Technical data: API tokens, integration logs, webhook payloads, IP addresses, device identifiers, error traces, and privileged session metadata.

Access Model

Provider requests temporary administrator access to ERP, ServiceNow, SharePoint, and integration middleware during implementation. Customer has not yet provided final privileged access approval, named account mapping, or production change-control signoff.

- All provider access must be named user access. Shared accounts, unmanaged API keys, and standing admin rights are prohibited unless separately approved as an exception.
- Provider shall use customer-approved bastion or PAM tooling, time-bound elevation, ticket references, session recording, and monthly access review.

Deliverables

- Integration inventory with system owner, data owner, source, target, data categories, transfer frequency, encryption method, and failure handling.
- Data mapping workbook showing field-level classification, transformation rules, retention needs, and exception routing.
- Runbook for monitoring, incident response, rollback, replay, data correction, and integration shutdown.
- Control evidence pack including access approvals, architecture diagrams, test results, dependency list, continuity plan, and exit procedure.

Regulatory And Control Requirements

Provider shall preserve segregation of duties in finance workflows, prevent unsupported payment authority changes, and route high-risk exceptions to customer finance control owners. Provider shall not approve its own changes or bypass customer release management.

Provider shall not copy production data into development or offshore support environments without masking, approval, and data owner signoff.

Security Controls

- Provider shall maintain ISO 27001 or SOC 2 Type II controls, annual penetration testing, vulnerability remediation tracking, endpoint hardening, and centralized logging.
- Provider shall enforce least privilege, MFA, named accounts, privileged access review, break-glass controls, and quarterly access recertification.
- Provider shall encrypt data in transit using TLS 1.2 or higher and encrypt data at rest using a recognized key management service.
- Provider shall notify Customer of confirmed security incidents without undue delay and no later than 48 hours after confirmation.

Audit, Evidence, And Records

- Provider shall preserve audit logs, integration logs, access approvals, configuration changes, incident tickets, and data export records for at least 18 months.
- Customer may request security attestations, remediation summaries, subprocessor lists, continuity evidence, and access reports during onboarding and annual review.

Continuity And Exit

Provider shall support customer continuity planning by documenting failover, manual processing workarounds, data replay, queue draining, and integration disablement. Exit assistance must include connector source code handover, secrets rotation support, and knowledge transfer.

Open Items

- Privileged access approval is not complete.
- Final data processing addendum is pending legal execution.
- Business continuity test evidence has not been supplied.
