

Cloud AI Model Services Statement Of Work

Aster Cognitive Cloud conversational assistant, document intelligence, retrieval, and model operations services

Synthetic legal-style test document for agent evaluation. Not legal advice. No real parties.

Project Description

Aster Cognitive Cloud will configure a private conversational assistant for enterprise knowledge retrieval, policy question answering, document triage, meeting summary generation, and compliance evidence extraction. The assistant will connect to SharePoint, Microsoft Teams exports, ServiceNow knowledge articles, Jira issues, Confluence spaces, Azure AI Search, and a customer data lake.

Data And Content

- Input data may include policies, procedures, contracts, supplier questionnaires, meeting notes, service tickets, architecture diagrams, audit findings, and selected email exports.
- Personal data may appear in documents, including employee names, email addresses, phone numbers, job titles, issue narratives, approver names, and access logs.
- Highly confidential data, secrets, credentials, private keys, health records, and payment card data must be excluded from indexing unless separately approved.

Model And Data-Use Commitments

- Customer content shall not be used to train, fine-tune, improve, benchmark, or evaluate shared provider models unless a separate opt-in is executed.
- Provider may use customer prompts and outputs only for tenant operations, abuse monitoring, troubleshooting, and quality review approved by customer.
- Provider shall support prompt and response logging controls, retention limits, redaction, and export of model interaction records.

Responsible AI Controls

- Provider shall document intended use, prohibited use, evaluation plan, human review boundary, fallback behavior, hallucination mitigation, and bias-sensitive data handling.
- Provider shall implement retrieval citations, confidence notices, no automatic approval for high-impact decisions, and escalation for legal, HR, finance, safety, or regulated advice.
- Provider shall run scenario-based tests for prompt injection, data exfiltration attempts, unsupported certainty, privacy leakage, and unsafe action recommendations.

Security Architecture

The service will use customer-managed identity provider SSO, tenant-scoped retrieval indexes, private network connectivity where available, key rotation, encrypted storage, API audit logs, and administrative access reviews.

Integrations

- Microsoft Entra ID for authentication and group mapping.
 - SharePoint and Teams exports for document retrieval.
 - ServiceNow and Jira for ticket knowledge retrieval.
 - Azure AI Search or approved equivalent for vector and keyword retrieval.
 - SIEM export for audit logs and security monitoring.
-

Operational Requirements

- - Provider shall provide uptime target of 99.5 percent for the assistant API after production acceptance.
- Provider shall support incident response, safety rollback, model version rollback, blocked prompt categories, and emergency kill switch.

Open Preconditions

- - Independent bias and robustness test results are not attached.
- Final RAI assessment is pending customer approval.
- Production data retention period is still subject to privacy approval.
- No go-live may occur until human approval, security signoff, and data owner approval are recorded.
